Education

KIT - KALAIGNARKARUNANIDHI INSTITUTE OF TECHNOLOGY Nov 2022 – April 2026

Bachelor of Artificial Intelligence and Data Science (CGPA: 8 / 10) *Coimbatore, Tamil Nadu.*

- **Relevant Coursework:** Data Science, Machine Learning, Data Structures and Algorithms.

Technical Skills

- **Core:** TypeScript, Node.js, React, Python, Next.js, Go
- **Web:** HTML, CSS, Tailwind CSS, Express, Astro.js
- **Databases:** PostgreSQL, MySQL, MongoDB, NeonDB, Pinecone
- **Tools & Cloud:** Git, GitHub, Docker, Kubernetes, GCP (Cloud Run, Cloud SQL)
- **AI Ecosystem:** MCP, APIs, RAG
- **Concepts:** System Design, Operating Systems, Databases, Machine Learning

Experience

MyAnatomy Integration - FullStack Developer (Remote) June 2025 - Dec 2025

React, Node.js, MongoDB, Pincone, OpenAI *Coimbatore, Tamil Nadu.*

- Contributed to **AgentHub** — a production AI platform where clients deploy RAG-powered support assistants with real-time chat, human escalation, and analytics.
- Built the document-ingestion and retrieval pipeline using **OpenAI Assistants API + Pinecone RAG** serving low-latency, context-rich responses to live support agents.
- Implemented **WebSocket**-based live chat with seamless human-takeover: preserved conversation context across handoffs and enabled agent escalation without session loss or user friction.
- Developed backend analytics APIs on **MongoDB** with auto-refresh, surfacing real-time KPIs — query latency, handover rate, resolution time — for support team dashboards.
- Shipped **657 tests** (529 backend + 128 frontend) with ∼85% overall coverage; optimized frontend bundle **39%** via tree-shaking, code-splitting, and lazy-loading.

Projects

Mithilla | ***Next.js, TypeScript, Medusa.js, NeonDB, Razorpay (Client Project)*** Mithilla.vercel.app

- Engineered a full-stack e-commerce storefront with **Next.js** 16 and Medusa v2 headless architecture — decoupling the **React** frontend from commerce logic for independent scaling across Vercel and Render.
- Used Next.js 16 Partial Prerendering and **use cache** with tag-based invalidation — pages serve from cache on every visit yet reflect backend updates within seconds.
- Secured auth with HttpOnly cookies, server-side input validation, and Upstash **Redis** sliding-window rate limiting across 5 API surfaces — blocking brute-force attacks without adding login friction.
- Integrated **Razorpay** as a pluggable Medusa payment module and built a custom Cloudinary file provider for **CDN** image delivery — replacing two default services with production-grade alternatives.

Gravity | ***TypeScript, Chrome Extension, MCP*** github.com/DharuNamikaze/Gravity-lite

- Gravity enables LLMs to inspect and debug live browser UI by querying real-time DOM values, computed styles, and box models via the Chrome DevTools Protocol.
- Solved the MV3 service worker 30-second termination problem by shifting the persistent WebSocket to a **Chrome Offscreen Document**, keeping the bridge alive indefinitely without keep-alive hacks.
- Implemented 10 MCP tools covering layout diagnosis, z-index stacking context analysis, flex/grid container inspection, element screenshotting, and page-level paint metrics.
- Designed a zero-config architecture where the extension connects out to the MCP server over WebSocket — eliminating native messaging, OS registry setup, and platform-specific launchers, making it **cross-platform**
- Packaged and published as **gravity-lite** on npm, works with all major MCP clients including Kiro, Cursor, VS Code, etc.
